# 1 About this operation manual

This operation manual is an integral part of the device.

- ▶ Before working on or with the device, always read the operation manual carefully and follow it for all activities at all times, especially the warnings and safety instructions.
- ▶ Keep the operation manual at hand at the device and hand it over to the new owner if the device changes hands.
- ▶ If you have any questions or if anything is unclear, ask the local partner of the manufacturer or the factory's customer service.
- ▶ Observe all reference documents.

## 1.1 Validity

This operation manual refers solely to the device identified by the nameplate (→ "Nameplate", page 7).

## 1.2 Reference documents

The following documents contain additional information to this operation manual:

- Heat pump guide, hydraulic integration
- Operating manual of the hydraulic unit or the wall-mounted controller
- Operation manual for the heating and heat pump controller
- Short description of the heat pump controller
- Operation manual for the extension board (accessory)
- Repair and service instructions for heat pumps with flammable (primary) refrigerant
- Logbook

## 1.3 Symbols and markings

### Identification of warnings

| Symbol | Meaning  |
|--------|--|
|        | Safety-relevant information. Warning of physical injuries.   |
|        | Safety-relevant information. Warning of physical injuries. Flammable materials / flammable (primary) refrigerant |

| Symbol           | Meaning  |
|------------------|--|
|                  | Safety-relevant information. Warning of physical injuries. Flammable materials / flammable (primary) refrigerant |
|                  | Safety-relevant information. Warning of physical injuries. Danger of fatal injury due to electric current.       |
| <b>DANGER</b>    | Indicates an imminent danger resulting in severe injuries or death.  |
| <b>WARNING</b>   | Indicates a potentially dangerous situation, which can result in severe injuries or death.                       |
| <b>CAUTION</b>   | Indicates a potentially dangerous situation, which can result in moderate or minor injuries.                     |
| <b>IMPORTANT</b> | Indicates a potentially dangerous situation, which can result in material damage.                                |

### Symbols in the document

| Symbol          | Meaning  |
|-----------------|--|
|                 | Information for specialist   |
|                 | Information for operator   |
| ✓               | Prerequisite for an action   |
| ▶               | Procedural instructions: Single-step instruction for action  |
| 1., 2., 3., ... | Procedural instructions: Numbered step within a multi-step instruction for action. Adhere to the given sequence. |
|                 | Additional information, e.g. a note for making work easier, information on standards                             |
| →               | Reference to further information elsewhere in the operating manual or in another document                        |
| •               | List   |
|                 | Secure connections against twisting  |

## 1.4 Contact

Addresses for purchasing accessories, for service cases or for answers to questions about the device and this operating manual can be found on the internet and are kept up-to-date:

- [www.alpha-innotec.com](http://www.alpha-innotec.com)

## 2 Safety

Only use the device if it is in perfect technical condition and only use it as intended, safely and aware of the hazards and under full observance of this operation manual.

### 2.1 Proper use

The unit is designed for household use and is solely intended for the following functions:

- Heating
- Domestic hot water preparation (optional, with accessories)
- Cooling, reversible
- ▶ Proper use includes complying with the operating conditions (→ “Technical data / scope of supply”, page 21) and the operation manual and observing the reference documents.
- ▶ When using the device, observe local regulations: laws, standards and directives.

Any other use of the device shall be considered improper use.

### 2.2 Personnel qualifications

The operating manuals supplied with the product are intended for all users of the product.

The operation of the product via the heating and heat pump control and work on the product which is intended for end customers / operators is suitable for all age groups of persons who are able to understand the activities and the resulting consequences and can carry out the necessary activities.

Children and adults who are not experienced in handling the product and do not understand the necessary activities and the resulting consequences must be instructed and, if necessary, supervised by persons experienced in handling the product and who are responsible for safety.

Children must not play with the product.

The product may only be opened by qualified personnel.

All procedural instructions in this operating manual are intended exclusively for qualified and skilled personnel.

Only qualified and skilled personnel are able to carry out the work on the device safely and correctly. Interference by unqualified personnel can result in fatal injuries and material damage.

- ▶ Ensure that the personnel is familiar with the local regulations, especially those on safe and hazard-aware working.
- ▶ Ensure that the personnel are qualified to handle flammable (primary) refrigerant.
- Work on the refrigerating circuit may only be carried out by qualified personnel with appropriate qualifications for refrigeration system installation.
- Work on the electrics and electronics may only be carried out by electrical technicians.
- Any other work on the system may only be carried out by qualified personnel (heating installer, plumbing installer).

During the warranty and guarantee period, servicing and repair work may only be carried out by personnel authorised by the manufacturer.

### 2.3 Personal protective equipment

During transport and work on the unit, there is a risk of cuts due to the sharp edges of the unit.

- ▶ Wear cut-resistant protective gloves.

During transport and work on the unit, there is a risk of foot injuries.

- ▶ Wear safety shoes.

When working on liquid-conveying lines, there is a risk of injury to the eyes due to leakage of liquids.

- ▶ Wear safety goggles.

### 2.4 Residual risks

#### Injuries caused by electric current

Components in the device are live with fatal voltage. Before working on the unit:

- ▶ Disconnect the device from the power supply.
- ▶ Protect the device against being switched back on again.
- ▶ Residual voltage at the inverter. Wait for 90 seconds before opening the device.

Existing earthing connections within housings or on mounting plates must not be altered. If this should nevertheless be necessary in the course of repair or assembly work:

- ▶ Restore earthing connections to their original condition after completion of the work.

### Risk of injury from moving parts

- ▶ Only switch on the device when the covers and fan protection grille are fitted.

### Injuries caused by high temperatures

- ▶ Before working on the unit, let it cool down.

### Safety instructions and warning symbols

- ▶ Observe the safety instructions and warning symbols on the packaging and on and in the unit.

### Injuries and environmental damage due to refrigerant

#### **WARNING**

**The unit contains flammable (primary) refrigerant that is hazardous to health and the environment. If (primary) refrigerant leaks from the unit, there is a risk of an explosion.**

If refrigerant leaks from the unit due to a leak, proceed as follows:

1. Switch off unit.
2. Ensure that all unauthorised persons leave the danger area immediately.
3. Remove possible ignition sources from the danger area and keep them away from the danger area.
4. Block access to the danger area for unauthorised persons.
5. Notify authorised after sales service.

If damage is visible on the outside of the unit, proceed as follows:

1. Switch off unit.
2. Notify authorised after sales service.

## 2.5 Disposal

### Environmentally hazardous substances

Improper disposal of environmentally hazardous substances (e.g. refrigerant, compressor oil) damages the environment:

- ▶ Collect substances safely.
- ▶ Dispose of the substances in an environmentally-friendly manner according to the local regulations.

## 2.6 Avoid material damage

The ambient air at the heat pump's installation site and the air drawn in as a heat source must not contain any corrosive components!

Constituents such as

- Ammonia
- Sulphur
- Chlorine
- Salt
- Sewage gases, flue gases

can cause damage to the heat pump, which can even result in the complete failure/total loss of the heat pump.

### Cooling

If the heating surfaces are used for heating and cooling, the control valves must be suitable for heating and cooling.

By cooling with low flow temperatures, condensate can be expected to form on the heat distribution system as the temperature falls below the dew point. If the heat distribution system is not designed for these operating conditions, it must be protected by appropriate safety devices, e.g. dew point monitor (purchasable accessory).

### Decommissioning/draining the heating

If the system/heat pump is decommissioned or drained after already being filled, it must be ensured that the condenser and any heat exchangers have been drained completely in the event of freezing temperatures. Residual water in heat exchangers and condensers can result in damage to the components.

- ▶ Completely drain the system and the condenser, and open vent valves.
- ▶ Blow them clear with compressed air, if required.

## Improper action

Requirements for minimum scale and corrosion damage in hot water heating systems:

- Professional planning and commissioning
- Closed system with regard to corrosion
- Integration of an adequately dimensioned pressure maintenance
- Use of demineralised heating water (VE water) or water corresponding to the VDI 2035 norm
- Regular servicing and maintenance

If a system is not planned, commissioned and operated in accordance with the given requirements, there is a risk of the following damage and malfunctions:

- Malfunctions and failure of components, e.g. pumps, valves
  - Internal and external leaks, e.g. at heat exchangers
  - Reduction in cross-section and blockages in components, e.g. heat exchangers, pipes, pumps
  - Material fatigue
  - Gas bubble and gas cushion development (cavitation)
  - Negative effect on heat transfer, e.g. due to formation of deposits, and associated noises, e.g. boiling noises, flow noises
- Observe the information in this operation manual for all work on and with the device.

## Unsuitable quality of the water for filling and replenishing the heating circuit

The efficiency of the system and the service life of the heat generator and the heating components depend decisively on the quality of the heating water.

If the system is filled with untreated drinking water, calcium and magnesium precipitate as mineral scale. Limescale deposits accumulate on the heat transfer surfaces of the heating. Efficiency is reduced and energy costs increase. In extreme cases, the heat exchangers will be damaged.

- Fill the system with deionised heating water (VE water) or with water corresponding to the VDI 2035 norm only (low-salt operation of the system).

## 3 Description

### 3.1 Condition on delivery

Packaged heat pump.

Separate package

### 3.2 Design

- |              |                         |
|--------------|-------------------------|
| 1 Evaporator | 4 Compressor            |
| 2 Switch box | 5 Condenser             |
| 3 Fan        | 6 Microbubble separator |
|              | 7 Inverseur             |
|              | 8 Plug-in connections   |

## Nameplate

The nameplate is attached at the following position on the device

- on the rear

It contains the following information at the very top:

- Device type, item number
- Serial number

The nameplate also contains an overview of the most important technical data.

## 3.3 Functionally necessary accessories

Only use genuine accessories made by the manufacturer of the device.

- Hydraulic station HSV 180 or HSV 280 or
- Hydraulic module HV6H or HV9H or
- Wall-mounted controller WR

## 3.4 Additional accessories

The following accessories are available for the unit via the manufacturer's local partner:

- Electrical connection kit EVS or EVS 8
- Wall duct or hydraulic connection line (each with vibration decouplings)
- Wall bracket
- Floor bracket
- Vibration decouplings
- Air / magnetic sludge separator
- Buffer tank
- Overflow valve
- Cladding for wall bracket
- Cladding for floor bracket
- Extension board
- Room control unit to control the main functions at the living quarters
- Room thermostat for switching the cooling function
- Dew point monitor for protecting a system with cooling function at low flow temperatures

## 3.5 Function

Liquid refrigerant is evaporated (evaporator). The energy for this process is ambient heat coming from the outside air. The gaseous refrigerant is compressed (compressor), which increases the pressure and thus also the temperature. The gaseous refrigerant at high temperature is liquefied (condenser).

In the process, the high temperature is transferred to the heating water and used in the heating circuit. The liquid refrigerant at high pressure and high temperature is expanded (expansion valve). The pressure and temperature drop and the process restarts.

The heated heating water can be used for domestic hot water or for heating the building. The temperatures required and the use are controlled by the heat pump controller. Any required reheating, support in screed drying or increase in the domestic hot water temperature can be carried out using an electric heating element, which is activated by the heat pump controller as required.

The vibration decoupling (accessory) for the hydraulic system prevents structure-borne sound and vibrations from being transferred to the fixed pipes and thus to the building.

### Cooling

The cooling function is integrated in the devices. The following options are possible for the cooling function (→ operating manual of the heating and heat pump controller):

- Active cooling  
Cooling down to a minimum flow temperature of 18°C possible
- The cooling function is controlled via the heating and heat pump controller
- Switching over between heating and cooling mode

## 4 Operation and care

### NOTE

The device is operated via the control panel of the heating and heat pump controller (→ Operation manual for the heating and heat pump controller).

### 4.1 Energy and environmentally aware operation

The generally applicable requirements for energy and environmentally aware operation of a heating system also apply to the use of a heat pump. The most important measures include:

- No unnecessarily high flow temperature
- No unnecessarily high domestic hot water temperature
- Do not open windows with a gap/in a tilted position (continuous ventilation), but instead open them wide for a short time (shock ventilation).
- Always ensure that the controller setting is correct

### 4.2 Care

Wipe off the outside of the device only using a damp cloth or cloth with mild cleaning agent (washing-up liquid, neutral cleaning agent). Do not use any aggressive, abrasive, acid or chlorine-based cleaning agents.

## 5 Delivery, storage, transport and installation

### IMPORTANT

Damage to the housing and the device components due to heavy objects.

- ▶ Do not place any objects that are heavier than 30 kg on the device.

### 5.1 Scope of delivery

- ▶ Check the delivery immediately on receipt for visible signs of damage and for completeness.
- ▶ Notify the supplier of any complaints immediately.

The separate package included contains

- Documents (operation manuals, ERP data and labels)
- Type stickers
- 1 Shut-off device with dirt trap
- 1 condensate drain pipe nozzle
- 3 fastening screws
- 1 sealing plate for floor duct
- 1 long torx bit for panel screws
- 2 cable ties
- Logo sticker for hydraulic unit

### NOTE

The outdoor sensor is included in the scope of delivery for the hydraulic unit

### 5.2 Storage

### WARNING

The unit may only be stored in rooms that do not contain ignition sources. Do not drill or torch!

- ▶ If possible, do not unpack the device until immediately before installation.
- ▶ Store the device protected against:
  - Moisture
  - Frost
  - Dust and dirt

## 5.3 Unpacking and transport

### Notes on safe transport

The device is heavy (→ “Condensate line”, page 43). There is a risk of injuries or material damage if the device falls down or overturns.

The hydraulic connections are not designed for mechanical loads.

- ▶ Do not lift or transport the device by the hydraulic connections.

Transport the device with a pallet truck if possible, or alternatively carry it

- ▶ Do not tilt the heat pump by more than 45°.

### Transport with a pallet truck

- ▶ Transport the device to the installation site in packaged form, and secured on a wooden pallet.

### Unpacking:

1. Remove plastic films. Make sure that you do not damage the device when doing this.
2. Dispose of the transport and packaging material in an environmentally sound manner and in accordance with local regulations.

### Carrying the device

#### NOTE

The device is delivered on a pallet with mounting rails (①). The mounting rails can be used for transport.

## 5.4 Installation

### Preparation for installation, together with the wall duct

To connect the outdoor unit to the indoor unit (hydraulic unit or wall-mounted controller), there must be a suitable opening for the wall duct (accessory) or an opening has to be cut out in order to insert the Ø125 mm waste water pipe (= wall duct accessory).

If the wall duct is not yet present, you can also use a commercially available waste water pipe, length 1 m, DN 125 in advance.

#### NOTE

Always comply with the installation plan for the respective device type. Observe the minimum clearances and protected zones.

- Installation plan, dimension drawings and scopes of protection for the respective device type.

#### CAUTION

**In the air outlet area the air temperature is approx. 5 K below the ambient temperature. Under certain climatic conditions, an ice layer can therefore develop in the air outlet area.**

**Install the heat pump so that the air coming from the air outlet opening is not discharged into footpath areas.**

#### NOTE

The surface in the air outlet area of the heat pump must be permeable to water.

If the wall duct is not used, the bus cable must be routed through a separate cable conduit, separated from the other cables.

The other two cables also have to be routed using empty conduits on site.

#### NOTE

The noise immissions of the heat pumps must be taken into account in the respective installation plans for air/water heat pumps. The respective regional regulations must be complied with.

## Installation site requirements

- Only install outdoors
- ✓ Clearance dimensions were complied.
- “Minimum clearances”, page 37
- ✓ Free air intake and blowing air are possible without any air short-circuit.
- ✓ The surface is suitable for installation of the unit:
  - The foundation is level and horizontal
  - The surface and the foundation have a load-bearing capacity sufficient for the unit's weight
- ✓ Ground surface in the air outlet area of the heat pump is permeable to water

## 5.5 Installation with a wall bracket

- Wall bracket installation instruction
- Wall duct installation instruction or
- Hydraulic connection line installation instruction
- “Installation plans wall bracket“, page 28
- “Minimum clearances“, page 37
- “Drill template for wall bracket“, from page 32

The wall bracket is only suitable for solid, load-bearing walls. In a timber-frame construction with facing, the floor bracket should be used due to the possible transfer of structurally borne sound to the interior.

## 5.6 Installation on a floor bracket

The device can be installed near a wall or as a free field installation. Ideally, the heat pump should be installed where it is protected from wind. If this is not possible, we recommend installing it at right angles to the prevailing direction of wind or air ducting in the main wind direction.

- ▶ Place the device on a load-bearing, firm and horizontal foundation.

The foundation must not be connected to the building. Make sure that the foundation is designed for the weight of the heat pump.

- Floor bracket installation instruction
- Wall duct installation instruction or
- Hydraulic connection line installation instruction
- “Installation plans floor bracket“, page 30
- “Minimum clearances“, page 37
- “View of foundation“, from page 34

### NOTE

When installing with a wall duct, make sure the wall clearance is correct.

## 5.7 Opening and closing the device

- ▶ Remove the cover and the side facade of the device.

- ▶ Close the device in reverse order.

## 6 Installation of hydraulic system

### 6.1 Condensate drain

The condensate precipitated from the air must be removed frost-free via a plastic condensate pipe with a minimum diameter of 40 mm. If surfaces are water permeable, it is sufficient for the condensate drain pipe to be routed vertically into the ground to a depth of at least 90 cm.

- ▶ Install the condensate pipe nozzle (①) on the condensate drain (②), which is included in the scope of delivery for the device, on the underside of the device using the enclosed screws.

#### Outdoors

- ▶ Connect the condensate pipe (wall duct accessory) to the condensate pipe nozzle.

→ “Wall duct installation instruction”

The condensate pipe must not be inserted into the ground on its own, it must first be inserted into a second pipe that is suitable for installation in the ground (such as a waste water pipe).

The connection between the pipes must be sealed. It must be possible to compensate the length. The pipe on the device must not press against the ground, it must be possible to slide it.

Sufficient seepage of the draining condensate into the ground must be ensured.

→ “External condensate line connection“, page 43

#### Towards the inside of the building

- ▶ Insert the condensate pipe (wall duct accessory) through the wall duct (accessory) (using lubricant) and connect it to the condensate nozzle using the enclosed plastic elbows.

→ “Wall duct installation instruction”

If the condensate pipe is not routed inwards, the front and rear openings in the wall duct have to be sealed with the enclosed plugs.

→ “Internal condensate line connection“, page 43

### 6.2 Connection to the heating circuit

#### IMPORTANT

Avoid open heating systems and / or heating systems that are not oxygen diffusion-tight.

If this is not possible, a system separation must be installed.

Depending on the dimensioning of the heat exchanger and the additionally required circulation pump, the system separation worsens the energy efficiency of the system.

#### IMPORTANT

Dirt and deposits in the (existing) hydraulic system can cause damage to the heat pump.

- ▶ Ensure that a air / magnetic sludge separator is installed in the heating circuit.
- ▶ Rinse the hydraulic system thoroughly prior to establishing the hydraulic connection of the heat pump.

#### IMPORTANT

Damage to the copper pipes due to impermissible load!

- ▶ Secure all connections against twisting.
- ✓ Cross-sections and lengths of the pipes for the heating circuit are adequately dimensioned.
- ✓ The free pressing of the circulation pumps in the heating circuit at least results in the throughput required for the device type (→ “Technical data / scope of supply“, page 21).
- ✓ The hydraulic system must be equipped with a buffer tank, the required volume of which depends on your device type.
- “Technical data / scope of supply“, page 21
- ✓ The lines for the heating are fastened to the wall or ceiling via a fixed point.
- ▶ Make sure that the working overpressure (→ “Technical data / scope of supply“, page 21) is complied with.

1. Install the shut-off device with dirt trap (included in the scope of supply) inside the building as close as possible to the transition to the outdoors.
- 1.1. Observe the flow direction of the shut-off device with dirt trap.
- 1.2. If possible, position the cleaning cap (①) of the shut-off device with dirt trap at the top.

- 1 Cleaning cap
- 2 Hydraulik pipe coming from the heating water outlet of the hydraulic unit
- 3 Heating water flow direction
- 4 Hydraulik pipe leading to the heating water inlet of the heat pump

- 1.3. Attach the hydraulic pipes to the right and left of the shut-off device with dirt trap via a fixed point to the wall or ceiling at a maximum distance of 20 cm from the shut-off device.
2. If no wall duct is used, route the fixed piping of the heating circuit outdoors below the frost line.
3. Insert the vent at the highest point of the heating circuit.
4. Attach the enclosed sealing plate (①) into the recess (②) in the floor of the device.

5. Connect the device to the fixed piping of the heating circuit via vibration decouplings (accessory or included in the scope of delivery of the wall duct or hydraulic connection line). You must install them to prevent the transfer of structurally borne sound to the fixed piping.

### NOTE

If an existing system is being replaced, the old vibration decoupling may not be reused.

→ Vibration decoupling installation instruction

- 5.1. Route the vibration decouplings through the feed-through (③) in the sealing plate.

- 5.2. Screw the vibration decouplings onto the two pipes in the wall duct or hydraulic connection line. Connect the flow line (④) first, then the return line (⑤).

Example: hydraulic connection line

- 4 Heating water outlet (flow)
- 5 Heating water inlet (return)

6. If no further connection work is carried out afterwards, mount the side facade and cover of the device.

## 6.3 Pressure safety

Equip the heating circuit with a safety valve and diaphragm expansion vessel in accordance with local standards and guidelines.

Also install filling and draining devices, shut-off devices and non-return valves in the heating circuit.

## 7 Electrical installation

### 7.1 Establishing the electrical connections

#### IMPORTANT

Irreparable damage to the compressor due to wrong rotating field (only applies to units with 400V connection).

- ▶ Ensure a clockwise rotating field for the compressor's load supply.

#### Basic information relating to the electrical connection

- Any specifications by the local energy supply company apply to electrical connections
- Equip the power supply for the heat pump with an all-pole miniature circuit-breaker with at least 3 mm contact spacing (IEC 60947-2)
- Note the tripping current level (→ "Technical data / scope of supply", page 21)
- Comply with the electromagnetic compatibility regulations (EMC regulations)
- Comply with current EMC requirements for household appliances
- Install unshielded power supply cables and shielded cables (bus cables) sufficiently far apart (> 100 mm)

The electrical connection of the heat pump with the hydraulic unit or the wall-mounted controller is established using the EVS8 or EVS accessory.

- EVS 8: sockets and plugs for load and bus cables with 8m cable each.  
Can be extended inside buildings with a maximum of 2 additional EVS 8.

→ EVS 8 installation instructions

- EVS: sockets and plugs for load and bus cables. Bus cable on site, maximum cable length of 30 m. The bus cable must be a shielded cable of at least 4 x 0.5 mm<sup>2</sup>.

As load cable:

A 3 x 2.5 mm<sup>2</sup> cable with protective conductor, Diameter of the sheath of the electric cable cable 9 – 13 mm<sup>2</sup>

- ▶ Mount the sockets (ⓑ) towards the heat pump, the plugs (Ⓢ) towards the hydraulic unit or the wall-mounted controller.

#### Mounting EVS 8 / EVS (accessories)

1. If the device is closed, open the device.  
→ "5.7 Opening and closing the device", page 10
2. Route the load and bus cables into the device from below through the cable feed-throughs (Ⓚ) in the sealing plate.

3. Connect the compressor load cable to the five-pin load cable socket.
- 3.1. Break a lock of one of the cable bushings (①) carefully out of the pre-engaged strain relief housing (②) and push the strain relief housing approx. 50 cm over the load cable (③).

3.2. Strip the load cable 55 mm.

3.3. Shorten the live wires so that the PE conductor has a lead of 8 mm.

3.4. Strip each wire 9 mm.

3.5. Insert the stripped wires into the pins (④).

- ▶ If the load cable has single wires, insert each of them as far as they will go.

Insert the N and PE conductor in the pins labelled accordingly and insert the L conductor in the L1 pin.

- ▶ If the load cable has fine wire strands:
  - Twist the strands of each wire.

3.5.1. Insert an operating tool or screwdriver (2.5 mm blade width) in the connection lock of the neutral conductor plug pin to unlock the connection lock.

3.5.2. Insert the twisted wire of the neutral conductor as far as it will go into the neutral conductor plug pin.

3.5.3. Pull the operating tool or screwdriver out of the neutral conductor plug pin to lock the connection.

3.5.4. Insert the PE conductor in the same way in the corresponding plug pin labelled on the plug. Insert the L conductor in the plug pin L1.

### IMPORTANT

Check each inserted wire for tight fitting in its plug pin.

3.6. Push the strain relief housing (②) onto the wired socket (④).

3.7. Align them correctly to each other: The top side of the socket and the top side of the strain relief housing are both marked with "TOP".

3.8. Push the socket as far as it will go into the strain relief housing.

3.9. Lock the top part of the strain relief housing firmly onto the bottom part.

3.10. Screw the strain relief screw tight.

4. Connect the bus cable (communication) to the bus cable socket.

4.1. Insert the contact spring (⑤) into pin 3 (⑥) up to the limit stop. The lugs on the broad end of the contact spring must point upwards (in the direction of the numbers on the socket).

**NOTE**

If the contact spring is in the way when subsequently inserting the wires of the bus cable, it can be disconnected and re-connected after inserting the wires.

4.2. Strip the bus cable 30 mm..

4.3. Push the shielding braid back 10 mm over the sheath.

4.4. Pull back the shielding foil up to the shielding braid and cut off.

4.5. Strip each core by 9 mm.

4.6. Twist the strands of each wire.

4.7. Insert the stripped wires into the pins.

4.7.1. Insert an operating tool or screwdriver (blade 2.5x0.4 mm) in the connection lock on pin 5 to unlock connection lock.

4.7.2. Place the cable with shielding braid onto the contact spring from above and insert the brown wire into pin 5 up to the limit stop.

4.7.3. Pull the operating tool or screwdriver out of the connection lock pin to lock the connection.

4.7.4. Insert the three other wires in the same way into the corresponding pins.

Assignments of the pins

|                                   |       |
|-----------------------------------|-------|
| white wire of the bus cable       | pin 1 |
| green wire of the bus cable       | pin 2 |
| Shielding braid on contact spring | pin 3 |
| yellow wire of the bus cable      | pin 4 |
| brown wire of the bus cable       | pin 5 |

### IMPORTANT

Check each inserted wire for tight fitting in its plug pin.

4.8. Place the shielding braid on the contact spring and, if necessary, shorten it so that it does not go beyond the contact spring.

5. Assemble the strain relief housing.

5.1. Snap the wired socket into the lower part (7) of the strain relief housing.

5.2. Fit the strain relief (9) and clip into place until the bus cable is clamped firmly.

### IMPORTANT

The shielding braid must have a direct and firm contact with the contact spring.

5.3. Snap the upper part of the housing (9) fully onto the lower part.

6. Connect the wired sockets of the load cable and the bus cable to the unit.

6.1. Open the strain reliefs on the unit.

6.2. Remove the cover for the plug-in connections.

6.3. Insert the load cable socket and bus cable socket up to the limit stop into the corresponding plugs.

- 6.4. Route both cables through the strain reliefs, close the strain reliefs and tighten the strain reliefs.

- 6.5. Secure both cables additionally with cable ties to the recesses in the partition wall.

- 6.6. Mount the cover of the plug-in connections.

- 6.7. Mount the side facade and the cover of the device.

7. Guide the load and bus cable in cable conduits from the heat pump up to the building feed-through, and from there to the electrical switch box of the hydraulic unit or to the wall-mounted controller inside the building.
8. Mount the plugs on the load cable and the bus cable in the same way as the sockets.

## IMPORTANT

The wire assignment of the bus cable plug must match the wire assignment of the bus cable socket.

- “Assignments of the pins”, page 16
9. Insert the load cable plug and bus cable plug up to the limit stop into the corresponding sockets on the underside of the electrical switch box of the hydraulic unit or in the wall-mounted controller.
- Operating manual of the hydraulic unit or  
→ Operating manual of the wall-mounted controller

## 8 Flushing, filling and venting

### 8.1 Heating water quality

#### NOTE

For detailed information refer, among other things, to the VDI Guidelines 2035 “Vermeidung von Schäden in Warmwasserheizanlagen” (preventing damage in hot water heating systems).

1. Ensure that the pH-value of the heating water is between 8.2 – 10, for aluminium materials between 8.2 – 9.  
Ideally, the pH value should already be in the required range after filling. After 6 weeks at the latest, it must have adjusted to the required range.
2. Ensure that the electrical conductivity is  $< 100 \mu\text{S}/\text{cm}$ .

#### NOTE

If the required water quality is not achieved, consult a company specialising in the treatment of heating water.

3. Fill the system with deionised heating water (VE water) or with water corresponding to the VDI 2035 norm only (low-salt operation of the system).  
Advantages of low-salt operation:
  - Low corrosion-promoting properties
  - No formation of mineral scale
  - Ideal for closed heating circuits
4. Keep a system log for hot water heating systems in which relevant planning data and the water quality are entered (VDI 2035).

## Antifreeze in the heating circuit

It is not permitted to fill an antifreeze or a water/antifreeze mixture into the heating circuit.

The heat pumps have safety devices that prevent the water from freezing, even when the heating is switched off. A prerequisite is that the heat pump remains switched on and is not disconnected from the mains. Should there be a risk of frost, the circulation pumps are activated.

## 8.2 Flushing, filling and venting the heating circuit

- ✓ The outlet pipe of the safety valve is connected.
- ▶ Ensure that the response pressure of the safety valve is not exceeded.

### IMPORTANT

Flush the heating circuit only in its flow direction.

#### NOTE

The venting programme on the controller can also be used to support the flushing and venting process. It is possible to control individual circulation pumps and even the changeover valve via the venting programme. As a result it is not necessary to remove the valve motor.

1. Vent the system at the highest point.
2. Vent the heat pump at the hydraulic connection set.

## 9 Insulation of hydraulic connections

Insulate hydraulic lines in accordance with the local regulations.

1. Open shut-off devices.
2. Perform a pressure test and check for leaks.
3. Insulate external piping on site.
4. Insulate all connections, fittings and pipes.
5. Insulate the condensate drain in a frost-proof manner.
6. The device must be completely closed on all sides to ensure rodent protection.

## 10 Overflow valve

→ Operation manual for the hydraulic unit

## 11 Commissioning

### CAUTION

**Prior to commissioning the unit, the facing panels must be closed and the fan protection grille must be mounted.**

- ✓ The relevant planning and design data of the system is documented in full.
  - ✓ The relevant energy supply company has been notified of the operation of the heat pump system.
  - ✓ The system is air-free.
  - ✓ Installation check using the rough checklist has been completed successfully.
  - ✓ Clockwise rotating field is present for the load supply at the compressor (only applies to units with 400V connection)
  - ✓ The system is installed and mounted according to this operation manual
  - ✓ The electrical installation has been carried out properly according to this operation manual and the local regulations
  - ✓ The power supply for the heat pump is equipped with an all-pole circuit-breaker with at least 3 mm contact spacing (IEC 60947-2)
  - ✓ The tripping current is complied with
  - ✓ The heating circuit has been flushed and vented
  - ✓ All shut-off devices of the heating circuit are open
  - ✓ The pipe systems and components of the system are tight
1. Carefully fill in and sign the notice of completion for the heat pump systems.
  2. In Germany: Send the notice of completion for heat pump systems and rough checklist to the manufacturer's factory customer service department.  
In other countries: Send the notice of completion for heat pump systems and rough checklist to the manufacturer's local partner.
  3. Arrange for the heat pump system to be commissioned by the manufacturer's authorised after sales service for a fee.
- "12.2 Maintenance after commissioning", page 19

## 12 Maintenance

### NOTE

We recommend that you conclude a maintenance agreement with your specialist heating company.

### NOTE

Water accumulations resulting from extreme weather conditions, or from condensation in, on and under the unit which do not flow away via the condensate discharge are normal and do not constitute a heat-pump malfunction or defect.

### 12.1 Basic principles

The cooling circuit of the heat pump does not require any regular maintenance.

Local regulations require, among other things, leak checks beforehand and/or for a logbook to be kept for certain heat pumps.

- ▶ Ensure compliance with local regulations with regard to the specific heat pump system.

### 12.2 Maintenance after commissioning

Check all installed dirt traps for dirt at the latest one week after commissioning and clean them if necessary.

- ▶ Switch off the system while the check and cleaning is being carried out.

Next checking and cleaning at the latest 2 weeks after commissioning.

### Cleaning the shut-off device with dirt trap

## 12.3 Maintenance as required

- ▶ Check and clean the components of the heating circuit, e.g. valves, diaphragm expansion vessels, circulation pumps, filters, dirt traps
- ▶ Always regularly control for unimpeded air infeed accordingly. Constrictions or even blockages which, for example occur
  - when applying house insulation with polystyrene balls
  - through packaging material (foils, films, cartons etc.)
  - through foliage, snow, icing or similar weather-related deposits
  - through vegetation (bushes, tall grass etc.)
  - through air shaft covers (fly protection screens etc.)

and which must be prevented and/or removed immediately

- ▶ Check at regular intervals that the condensate can drain out of the device freely, without obstruction. To this end, check the condensate pan in the device regularly for dirt/clogging and clean as necessary. Also check the evaporator from all sides and clean if necessary

### NOTE

Icing on air infeed and outfeed openings is weather-related and normal. Do not remove icing thermally.

- ▶ Wear protective gloves and carefully remove the icing with your hands.

## 12.4 Cleaning and flushing the condenser

1. Clean and flush the condenser according to the manufacturer's instructions.
2. After flushing the condenser with chemical cleaning agent: neutralise any residues and flush the condenser thoroughly with water.

## 12.5 Annual maintenance

- ▶ Determine the quality of the heating water by analysis. In the event of deviations from the specifications, take suitable measures without delay
- ▶ Check all installed dirt traps for dirt and clean them if necessary
- ▶ Test the function of the safety valve for the heating circuit

## 13 Malfunctions

1. Read out the cause of the malfunction via the diagnostic programme of the heating and heat pump controller.

### NOTE

In the event of a high pressure or flow fault, check the dirt trap of the shut-off device and clean if necessary.

2. Consult the manufacturer's local partner or the factory's customer service. Have the fault message and device number ready at hand.

## 14 Dismantling and disposal

### 14.1 Dismantling

- ✓ The disposal equipment is suitable for flammable refrigerants.
- ✓ The locally applicable regulations for handling flammable refrigerants are complied with.
- ▶ Keep away from sources of ignition.
- ▶ Collect all substances safely.
- ▶ Separate components according to their materials.

### 14.2 Disposal and recycling

- ▶ Dispose of environmentally hazardous substances (e.g. refrigerant, compressor oil) according to the local regulations.
- ▶ Ensure the correct recycling or disposal of device components and packaging materials in accordance with the local regulations.

# Technical data / scope of supply

| Performance data  |                                    |                        |  | Hybrox 5               | Hybrox 8               |

| Pos. | Name   |
|------|--|
| WP   | Heat pump  |
| SB   | Protection zone                                    |
| H1   | to the floor                                       |
| 1    | Doors, windows, light wells etc. into the building |

**Important:** The heat pump must only be installed outdoors! The heat pump must not be set up in depressions or in places where refrigerant can accumulate in the event of a leak.  
 The heat pump must be positioned so that, in the event of a leak, no refrigerant can enter the building or endanger persons in any other way.

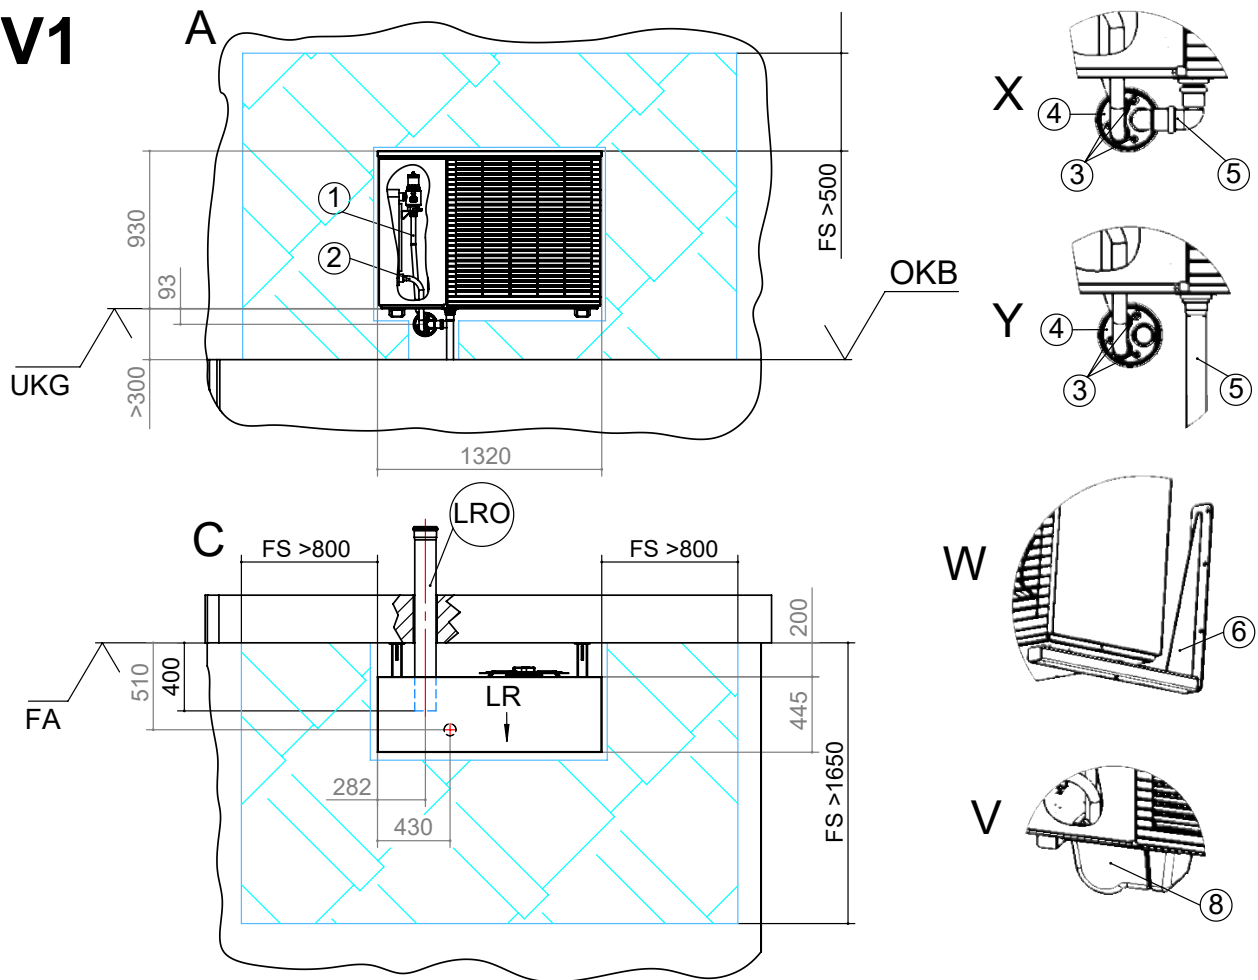

In the protection zone between the upper edge of the device and the floor, there must not be any sources of ignition, windows, doors, ventilation openings, light wells or similar.  
 The protection zone must not reach into neighbouring properties or public traffic areas.  
 The wall duct through the building envelope must be designed to be gas-tight.

# Hybrox 5 / Hybrox 8

# Parallel mode

## Basic information

The parallel mode makes it possible to connect up to four Hybrox heat pumps of the same kW capacity class so that they work together in a common heating system.

Each individual Hybrox heat pump must be connected either to a hydraulic module or to a wall-mounted controller.

The integration of a hydraulic station is not possible in parallel mode.

Parallel mode requires the integration of a stratified buffer tank.

Minimum volume of the stratified buffer tank:

|             |             |             |
|-------------|-------------|-------------|
| 2x Hybrox 5 | 3x Hybrox 5 | 4x Hybrox 5 |
| 86 l        | 108 l       | 116 l       |

|             |             |             |
|-------------|-------------|-------------|
| 2x Hybrox 8 | 3x Hybrox 8 | 4x Hybrox 8 |
| 138 l       | 173 l       | 186 l       |

### NOTE

If only 2 Hybrox heat pumps (1 master plus 1 slave) are connected to each other for parallel mode, it is also possible to integrate a multi-functional domestic hot water storage tank instead of a stratified buffer tank.

If a multi-functional domestic hot water storage tank is integrated, the operating mode "heating" and the operating mode "cooling" are always blocked for the entire system as long as the slave is preparing domestic hot water.

### IMPORTANT

Special hydraulic integrations apply to heat pumps in parallel mode. These are available on the manufacturer's website.

### IMPORTANT

Make sure that the hydraulic and electrical connections of the wall-mounted controller or hydraulic unit are only connected to the heat pump intended for this wall-mounted controller or hydraulic unit.

Further information on the connection of the heat pumps as well as on functions of parallel mode and settings that must be made on the heating and heat pump controller:

- Operation manual for the heating and heat pump controller, part 2, program area "Parallel mode"

## Increase of sound level in parallel mode

In parallel mode of several heat pumps installed in close proximity to each other, the sound pressure level of the individual heat pumps increases to a sum sound level.

The maximum sum sound level for parallel mode in full load operation can be determined in this way:

1. Select the sound calculator on the manufacturer's homepage.
2. Select the heat pump type in the sound calculator or enter "Sound power level outside combined max." from the technical data.
3. Carry out the calculation with the heat pump whose installation is the most unfavourable from a sound engineering point of view. Carry out the calculation based on the respective installation situation and the required distance.
4. Add to the calculated sound pressure level dB(A) the value of the sound level increase dB that applies to the number of equally loud heat pumps installed:

| Number of equally loud heat pumps | Sound level increase dB |
|-----------------------------------|-------------------------|
| 2                                 | 3,0                     |
| 3                                 | 4,8                     |
| 4                                 | 6,0                     |

# Protection zones / safety distances for parallel mode

Hybrox 5 / Hybrox 8

Keys: UK819545a-1

| Pos. | Name            |
|------|-----------------|
| H1   | to the floor    |
| SB   | Protection zone |
| WP   | Heat pump       |

**Important:** The heat pumps must only be installed outdoors! The heat pumps must not be set up in depressions or in places where refrigerant can accumulate in the event of a leak.  
The heat pumps must be positioned so that, in the event of a leak, no refrigerant can enter the building or endanger persons in any other way.

In the protection zone between the upper edge of the device and the floor, there must not be any sources of ignition, windows, doors, ventilation openings, light wells or similar.  
The protection zone must not reach into neighbouring properties or public traffic areas.  
The wall duct through the building envelope must be designed to be gas-tight.

| LR   | Direction of air  |
| WS   | Wind protection, functionally relevant area for heat pump |

The installation must be chosen in such a way that

- a sufficient air supply is guaranteed
- the air flows do not cross
- recirculation is avoided

## External condensate line connection

## Hybrox 5 / Hybrox 8

Keys: 819400-1

| Pos. | Name  |
|------|---|
| KS   | Gravel bed for holding up to 50 l condensate per day as buffer zone for seepage |
| 3    | Condensate drain pipe DN 40 (on site)   |

**Important:** If the condensate is discharged directly into the ground (figure 1a), the condensate drain pipe (③) must be insulated between the ground and the heat pump.

**Important:** If the condensate is discharged directly into a sewage or rainwater pipe, a waste trap must be applied (figure 1b). A vertically installed, insulated plastic pipe must be used above the ground. In addition, no non-return valves or similar must be installed in the drain pipe. The condensate drain pipe must be connected in such a way that the condensate drain pipe can flow freely into the main pipe. If the condensate is discharged into drains or the sewage system, ensure installation with a gradient.

It must be ensured that the condensate is discharged frost-free in all cases (figure 1a and figure 1b).

## Internal condensate line connection

Keys: 819400-2

**Important:** If the condensate line is connected inside a building, a waste trap must be installed with an airtight connection to the drain pipe (see figure 2a).

No additional drain pipes may be connected to the condensate drain pipe of the heat pump. The drain pipe into the sewage system must be clear, i.e. neither a non-return valve nor a waste trap must be installed downstream of the heat pump's connection cable.

It must be ensured that the condensate is discharged frost-free in all cases (figure 2a).

**IMPORTANT**

The minimum distances necessary for correct and safe operation as well as any service work must be observed.

- facing away from the coast / prevailing wind direction
  - ✓ in a sheltered area near a wall
  - ✓ not in open areas
  - ✓ not in sandy surroundings (to avoid the influx of sand)

- on the seaward side

- ✓ in an area near a wall
- ✓ an impermeable windbreak resistant to onshore winds is installed
- ✓ Height and width of the windbreak  $\geq 150\%$  of the device dimensions
- ✓ not in sandy surroundings (to avoid the influx of sand)

|  | - WTPSK Stratified storage tank, wall-mounted (cooling) |  | Sensor external return                                  |
|  | Multifunction tank                                      |  | Sensor return   |
|  | Domestic hot water tank                                 |  | Flow sensor   |
|  | Volume flow meter                                       |  | Sensor desuperheater                                    |
|  | Heat meter  |  | Heating circuit   |
|  |   |  | Heating mixing circuit                                  |
|  |   |  | Cooling circuit   |
|  |   |  | Cooling mixing circuit                                  |
|  |   |  | Safety package primary                                  |
|  |   |  | Safety package secondary                                |
|  |   |  | Circulation pump desuperheater                          |
|  |   |  | Controls supplied by customer                           |

Split:

|          |   |
|----------|---|
| QN10     | Switching valve domestic hot water / heating              |
| QN12     | Switching valve cooling / heating                         |
| QN11     | Mixing valve additional heating                           |
| GP12     | Circulation pump  |
| BT1      | Outdoor temperature sensor                                |
| BT7      | upper domestic hot water (displayed value)                |
| BT3      | Sensor return   |
| BT6      | Sensor domestic hot water                                 |
| BT64     | Flow sensor cooling                                       |
| BT15     | Temperature sensor, liquid state                          |
| BT25     | Flow temperature heating                                  |
| BT71     | Return temperature heating / cooling                      |
| BT52     | Sensor heating boiler                                     |
| BT50     | Room temperature sensor                                   |
| XL1      | Flow heating  |
| XL2      | Return heating / cooling                                  |
| XL3      | Cold water  |
| XL4      | Domestic hot water  |
| XL5      | Circulation   |
| XI10     | Flow cooling  |
| XL13     | Liquid refrigerant  |
| XL14     | Gaseous refrigerant                                       |
| XL18     | Flow second heat generator                                |
| XL19     | Return second heat generator                              |
| X2       | Terminal second heat generator                            |
| EP Split | Expansion board Split (not included in scope of delivery) |

Controls supplied by customer / on-site components:  
 Parts and components shown in the colour "grey" must be provided by the customer and also operated with a regulation provided by the customer.  
 The temperature difference control SLP of the additional board is excepted from this.

General:  
 Pipes, fittings and fixtures must be designed and insulated in accordance with the current and valid standards, guidelines and recognised rules of technology (e.g.: vapour diffusion-tight insulation if the temperature falls below the dew point).

| Equipment | Description   |
|-----------|---|
| B2        | Volumetric flow meter   |
| B10       | High-pressure sensor  |
| B11       | Low pressure sensor   |
| E20 / E21 | Compressor heating  |
| F1        | High-pressure switch  |
| F2        | Temperature switch  |
| F6        | Fuses ventilator  |
| G1        | Fan   |
| K21       | Defrost valve   |
| K22       | Electronic expansion valve heating  |
| K23       | Electronic expansion valve cooling  |
| M1        | Compressor  |
| Q10       | inverter  |
| R1        | Suction sensor, condenser   |
| R2        | Sensor compressor heating   |
| R3        | Liquid temperature heating  |
| R4        | Liquid temperature cooling  |
| R5        | Hot gas sensor  |
| R6        | Heat source input sensor  |
| R9        | Coding resistor; Hybrox 5 / Helox 5: 11,5kOhm; Hybrox 8 / Helox 8: 12,1kOhm         |
| RF1       | Mains filter  |
| X8        | Distribution box power supply output compressor                                     |
| X10       | Terminal strip in switchbox of heat pump; N/PE distribution for external 230V units |
| X20       | MODBUS circuit board  |
| X200      | Control connector   |
| XSE       | Sensorcard  |
| XSH       | Shield clamp Control unit   |
| +MRI      | Machine room  |
